

VERIZON X RBS

Harsha Ahmed | Alice Jiang | Grace Wu | Abbie Chu | Michelle Kim | teamru360@gmail.com

Vision

"RU360's vision is to build a campus where technology saves time, reduces stress, and brings people together — powered by Verizon's innovation."

The Problem

Each day, more than 80,000 people across Rutgers' New Brunswick, Newark, and Camden campuses compete for roughly 30,000 parking spaces, creating persistent congestion and frustration. On peak mornings, the College Avenue and Busch lots reach nearly **full capacity before 10 a.m.**, while Newark and Camden commuters face similar shortages during rush hours. Students often spend **5 to 10 minutes** searching for an open spot, wasting more than **100,000 hours each semester** and generating over **400 tons of unnecessary CO₂ emissions**. Many students report being late to class twice a week simply because they cannot see where parking is available. The issue isn't limited capacity but a lack of visibility and connectivity between systems, a challenge shared by thousands of universities and cities nationwide that need smarter, data-driven mobility solutions.

Market Opportunities

Rutgers Pilot Market:

67,000 students, 13,000 faculty, 30,000+ parking spaces, 3 campuses.

Broader University Market:

4,000+ U.S. colleges and universities suffer from congestion and mobility challenges.

Expansion Verticals:

Municipalities, stadiums, airports, corporate campuses, and other spaces such as libraries or event centers for crowd management.

Market Size:

The global smart campus market is expected to surpass >\$35B by 2030, led by smart mobility solutions.

Adoption Drivers:

5G rollout, sustainability mandates, and demand for improved student experience.

Competitors:

UniView, unlike ParkMobile, SpotHero, and Passport, is powered by Verizon 5G with real-time IoT sensor data, campus-wide connectivity, and analytics-driven insights.

Uniview (Scarlet Impact)

UniView is an IoT-powered occupancy tracking and parking optimization system that leverages **Verizon's 5G Ultra Wideband network** and **edge computing** to deliver real-time visibility and seamless connectivity across campus. Unlike traditional parking sensors, UniView is fast, scalable, privacy-compliant, and fully integrated into Verizon's 5G ecosystem. Beyond solving parking, UniView reimagines how campuses move by combining sustainability, safety, and connectivity into a single data-driven platform.

Students/Faculty

View and reserve parking in real time through a standalone **mobile app powered by Verizon 5G** and edge analytics. **Push notifications** and **digital display boards** at lot entrances show available spaces, **reducing time spent circling** and **lowering emissions**.

Administrators

Track parking and crowd density across New Brunswick, Newark, and Camden campuses using a live analytics dashboard. **Insights on demand** and utilization help **optimize space, guide infrastructure planning**, and strengthen safety and sustainability efforts.

Event Managers

Access live occupancy data and predictive insights during major events. **Dynamic alerts** and **capacity tracking** help direct traffic, **reduce congestion**, and ensure smoother crowd movement before and after events. **Optimization of crowds and parking during major events.**

Go-To Market Strategy

Phase 1 (Q2, 2026- Q1, 2027) - Pilot At New Brunswick

- Launch UniView, a stand-alone mobile app powered by Verizon 5G Ultra Wideband and edge computing.
- Deploy at College Avenue and Busch campuses with IoT sensors and digital display boards for real-time parking visibility.
- Coordinate setup with Rutgers Facilities and Verizon's campus technology team for fast, low-cost installation.
- Pilot cost ~ \$100K, including:
 - \$45K hardware (sensors and digital boards)
 - \$30K app development and analytics integration
 - \$15K marketing and user incentives
 - \$10K data hosting and maintenance
- Costs recoverable within 18 months through efficiency and sustainability gains.
- Enable short-term reservations and allow faculty to release unused spaces during off-peak hours.
- Incentivize participation through gamified reward points for sustainable behavior.
- Track adoption, congestion reduction, and ROI through real-time analytics dashboards.

Phase 2 (Q2, 2027- Q4, 2028) - Rutgers Expansion

- Scale UniView across New Brunswick, Newark, and Camden campuses, adding >100 parking zones.
- Use Verizon 5G to connect additional data sources like events, shuttles, and foot traffic for predictive mobility insights.
- Expansion cost ~ \$250K, including additional hardware, integration, and support.
- Offer optional API integration with the Rutgers app and publish a Smart Campus case study highlighting measurable impact (time saved, CO₂ reduced, etc).

Phase 3 (2028+) - Regional/National Scaling

- Use Rutgers' success as proof of concept to expand to Big Ten universities, corporate campuses, and municipal mobility networks.
- Implementation cost ~ \$75K per university, depending on size and IoT scope.
- Leverage Verizon's national 5G infrastructure and enterprise partnerships for turnkey installation, cloud hosting, and analytics.
- Projected recurring revenue: \$25K-\$75K per university annually, yielding ~ \$500K+ ARR after 10 adopters.

Risks & Mitigation

LOW STUDENT ADOPTION?

Integrate API into the existing Rutgers app and incentivize usage through gamification.

PRIVACY CONCERNS?

Anonymized data, encrypted transmission, compliance with NJ Privacy Act.

INSTITUTIONAL COST BARRIERS?

Phased rollout beginning with high-traffic areas, demonstrating ROI before expansion.

Business Model

Subscription Model

Universities pay annual fees of ~\$30K for UniView platform access, analytics, and maintenance, leveraging Verizon 5G connectivity for reliability and scale.

Event Partnerships

Temporary UniView setups for large events (\$5K-\$10K per event).

Development Optimization

Anonymized data subscriptions (\$10K per year per institution) for mobility analytics and sustainability planning.

Data Monetization

Use Verizon's 5G and IoT network to reduce latency and installation costs across new sites.

Verizon

- Acts as core enabler and technology partner for UniView.
- Demonstrates 5G and edge computing in a real-world, high-impact use case.
- Builds brand visibility and loyalty among students and universities.
- Creates a scalable B2B revenue stream through Smart Campus partnerships.

Impact

For Rutgers:

- Save thousands of student/faculty hours per year.
- Reduce CO₂ emissions by 400 metric tons annually.
- Improve campus safety and visitor satisfaction
- Position Rutgers as a Smart Campus Leader in the Big 10

For Verizon:

- Showcase real-world applications of 5G Ultra Wideband.
- Build long-term brand loyalty with Gen Z students.
- Create a scalable new revenue stream in the education and smart city markets.
- Strengthen Verizon's role as a national leader in smart campus and smart mobility solutions.

References/Rationale

Data on Rutgers campus size and parking demand (80,000 commuters and 30,000 spaces) was obtained from Rutgers Transportation and Parking statistics. CO₂ emission estimates (approximately 400 tons per year) use the U.S. EPA standard of 8.887 kilograms per gallon of gasoline, assuming about ten minutes of daily idling for 20,000 vehicles. Estimates of the time spent by students parking and being late for class are based on a survey taken by RU360 in Rutgers University. Smart campus market projections exceeding 35 billion dollars by 2030 reference WiseGuy Research (2023) and Strategic Revenue Insights (2024). Pilot cost assumptions of about 100 thousand dollars reflect IoT hardware priced at 150 to 250 dollars per sensor, app development and analytics at 30 thousand dollars, marketing and user engagement at 15 thousand dollars, and data hosting and maintenance at 10 thousand dollars. Expansion costs and subscription pricing (25 to 75 thousand dollars per campus annually) align with typical SaaS and university technology benchmarks. Performance metrics showing 40 percent faster parking, 25 percent lower congestion, and 20 percent CO₂ reduction are supported by UCLA Smart Parking (2019) and INRIX Mobility Studies (2022). ROI and adoption targets are modeled after campus technology rollouts such as Canvas and Handshake, which achieve 60 to 80 percent adoption within the first year.
